

MonkeySee

Matt Meredith | Christian Brandt

Who We Are

- Two freshman Computer Science students at the University of Delaware
- Passionate about making CS accessible to everyone

The Problem

- CompSci Education is boring
- Text based CSed killed my love for programming in High School
- Without tangible results, students lack motivation to keep progressing and creating new ideas

What Are We

- A solution
- Available on iPhone, Android, and Web

Bring your ideas to life with MonkeySee

- Learn coding principles
- Create functional solutions or demo your skills
- Make them look just how you like
- Run and test without leaving the app

How Does it Work

React Native codebase controls our IOS, Android and Web app.

Firebase Cloud backend to stores our tutorials, example code, and in the future, user data and our autograder.

Challenges We Faced

- Managing state within our editor
- Multi-Platform compatibility with React Native
- React UI styling
- OpenAI API Integration
 - Didn't have time to implement proper backend server for Chat GPT, to protect API key

HTML button

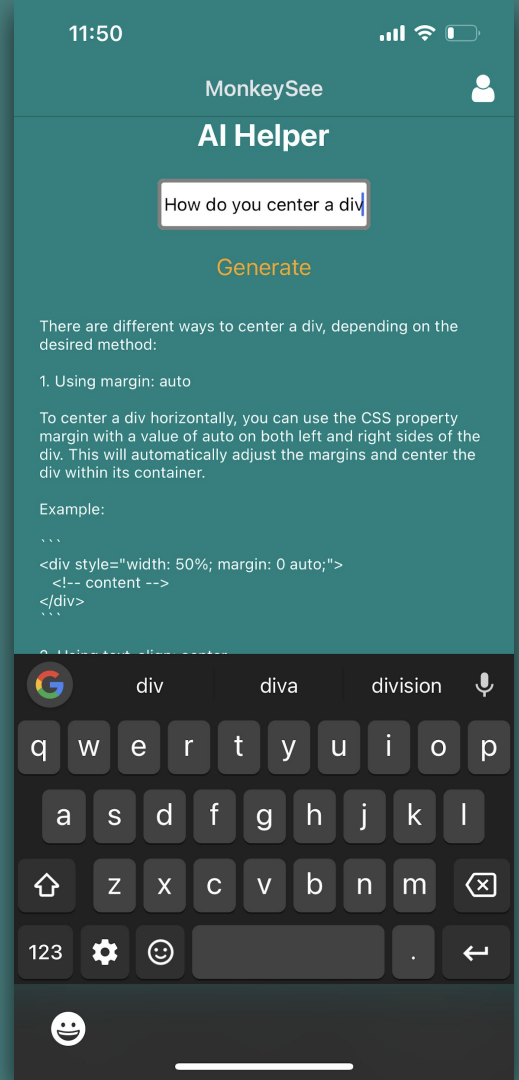

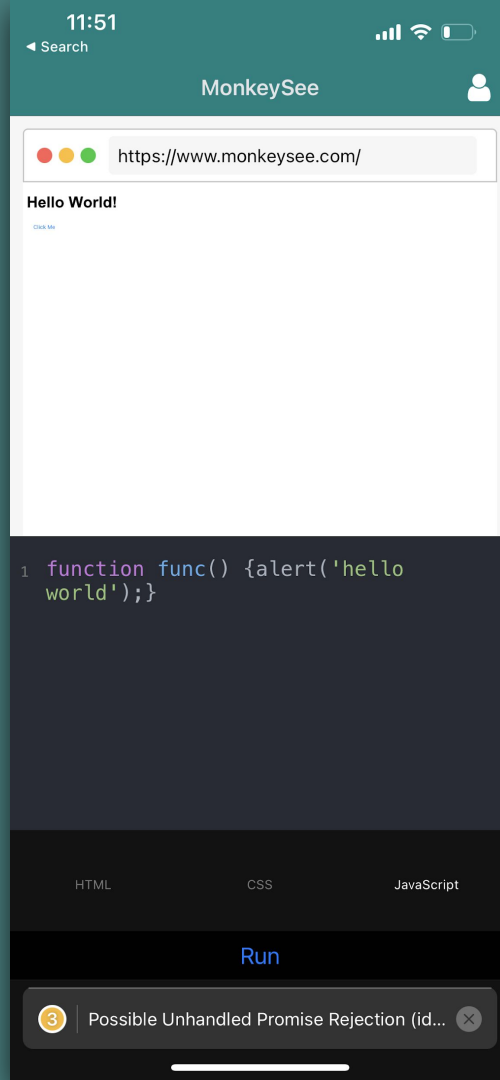

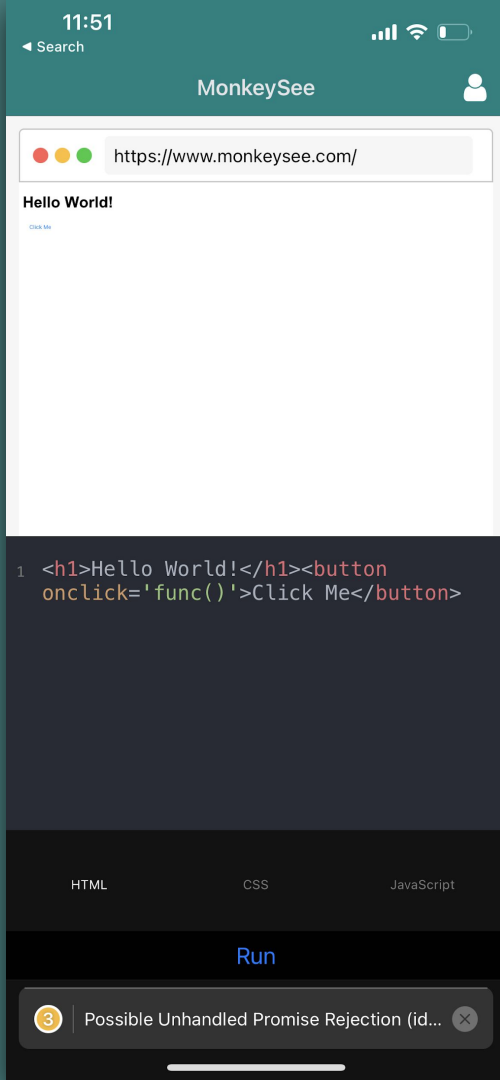

GENERATE

HTML button is an interactive element used on web pages to trigger an action or perform a task. It is created using the `<button>` tag in HTML and can be customized using CSS. The button can be used to submit a form, navigate to a different page or perform any other action based on the code written in the event listener.

Example:

```
<button>Click Me</button>
```

What's Next

- Chat GPT Auto-feedback
- Drag and drop code blocks
- Comprehensive lessons and curricula
- UI Revamp
